Cirklz is an advanced granular delay with a unique, one of a kind user interface based on a convenient Reaktor bug. Be prepared to mangle, transform, re-arrange and beautifully obliterate the audio you feed it.

How it works:

There are two main parts: the touchpad and modulation sequencer. Each circle on a touchpad has its own color and represents its own parameter. The X position controls the parameter's main value, while the Y position controls the sequenced modulation amount applied to the main values. By moving these circles you can adjust drastically manipulate settings on the fly.

The modulation sequencer has 5 separate pages (one for each parameter). Each page (sequence) has its own settings. In addition there is a special freeze sequencer to add some more sound flexibility.

There is an interactive manual inside the ensemble as well.
